WELD-ON® 724™

CHEMICAL RESISTANCE DATA

Weld-On commissioned an independent third-party laboratory to conduct chemical resistance tests on CPVC and PVC piping systems under controlled pressure and temperature conditions similar to those normally found in the chemical processing industry. The tests were conducted for continuous 2,500 hours with CPVC and PVC piping systems carrying a variety of chemical solutions. **The resulting data conclusively showed no joint failure in all tests.**

CPVC TEST DATA

All CPVC joints were solvent-welded with Weld-On 724. Test duration = 2,500 hours.

There will be variables that will affect the chemical resistance of thermoplastic piping systems such as: temperature, pressure, chemical concentration, and external stresses that may exist in the design and construction of the system. Be sure to take into consideration the specific use conditions that will apply to your project. The final decision to use CPVC or PVC piping should be based on in-service testing and evaluation by the responsible engineer and end-user.

The use of Weld-On® P-70™ Purple Primer is recommended when installing CPVC and PVC piping systems for chemical applications.
